

P31 Marketplace & Collective

BLUEHOST GUIDE · DOMAINS & TEAM EMAIL

Bluehost is where both P31 web addresses, **p31market.com** and **thep31collective.org**, are registered and managed. It doesn't run the websites themselves (they run on Vercel), but it holds the "address book" that tells the internet where everything lives: the websites, every team inbox, and the proof that our emails are really from us. If a setting here is wrong, a site can stop loading, emails can bounce, and messages can land in spam.

1 Why Bluehost needs to stay connected

Visitors & Google
type p31market.com or
thep31collective.org

Bluehost
the address book (DNS) for both
domains, plus team email

Where it sends them
websites → Vercel · email →
Bluehost inboxes

WHAT BLUEHOST DOES	WHAT IT MEANS FOR P31	IF IT BREAKS
Points to the websites	Sends every visitor to the live P31 websites, which run on Vercel.	The sites stop loading.
Holds the team inboxes	founder@, member@, vendor@, grants@ and the rest all live in Bluehost email. The websites, Carla (our DM assistant) and every contact page now send people to these addresses.	Emails bounce and leads are lost.
Proves our email is real	Three records (SPF, DKIM, DMARC) tell Gmail and Outlook that mail from our domains is genuine.	Our emails land in spam.
Verifies us with services	Google Search Console (so new pages show up in Google) and our email-sending service for alerts and campaigns both confirm ownership with a record here.	New pages aren't found on Google; alerts and campaigns can't send.
Keeps the names ours	Both domain names are renewed through Bluehost.	If a renewal lapses, everything above stops at once.

2 Where things stand today

CHECK	P31MARKET.COM	THEP31COLLECTIVE.ORG
Website points to Vercel	✓ Connected	✓ Connected
Email server (MX) set up	✓ Bluehost mail	✓ Bluehost mail
SPF and DKIM (anti-spam proof)	✓ In place	✓ In place
DMARC (anti-spoofing policy)	✓ Monitoring mode	✓ Monitoring mode
Each team address exists	To confirm (step 4)	To confirm (step 4)

Checked October 9, 2026. Nothing needs to be changed. The steps below are about confirming the inboxes and knowing what to leave alone.

3 Sign in to Bluehost

1. Go to **bluehost.com** and click **Login**.
2. Sign in with the account that owns both domains. You'll land in the **Bluehost Portal**.

Turn on two-step login for this account (in your Bluehost profile or security settings). Whoever controls this login controls both websites and every team inbox.

4 Check the team inboxes

Open the list of email addresses:

1. In the left menu, click **Hosting**, then **My Plans**.
2. On the right, click **cPanel Email**.
3. In the pop-up, click **Email Accounts**, then **Continue**.
4. Use the search box to find each address below. Tick it off when you see it.

ADDRESS	WHO READS IT	WHAT IT'S FOR
☐ founder@thep31collective.org	Melanie JC	Vision, leadership, partnerships
☐ ceo@p31market.com	Melanie JC	Marketplace leadership
☐ secretary@thep31collective.org	Savannah Campbell	Admin support, scheduling
☐ secretary@p31market.com	Savannah Campbell	Services inquiries, outreach
☐ marketing@p31market.com	Yanni Bratcher	Marketing, press, collaborations
☐ member@thep31collective.org	Alexia Thomas	Mentorship members (main Collective contact)
☐ outreach@p31market.com	Alexia Thomas	Community, events (main market contact)
☐ coordinator@thep31collective.org	Shanay Prince	Support and operations
☐ grants@p31market.com	Shanay Prince	Grants, sponsors, partnerships
☐ vendor@p31market.com	Anthony Carr	Curator and vendor help

5 Add any missing address

Option A: a full inbox (the person logs in to read it)

1. In **Email Accounts**, click **+ Create** (top right).
2. Pick the **Domain**, type the **Username** (for example `vendor`), and set a strong **Password**.
3. Click **Edit Settings** and raise the **storage**. Starter plans allow only 100 MB, and a full inbox bounces new mail.
4. Click **+ Create**.

Option B: a forwarder (mail goes to an inbox they already use)

1. Go back to **cPanel Email** and choose **Forwarders**.
2. Click **Add Forwarder**. Type the address (for example `grants`), choose the domain, then enter the inbox it should go to.
3. Click **Add Forwarder**.

Bluehost turns off “catch-all” addresses on shared plans, so **every address the website uses must exist as an inbox or a forwarder**. Mail to an address that doesn't exist simply bounces.

6 Test every inbox (5 minutes)

1. From a personal email (Gmail, iCloud...), send one message with the subject **“P31 inbox test”** to all ten addresses above.
2. A reply saying *“Address not found”* or *“Undeliverable”* means that address is missing. Go back to step 5.
3. Ask each person to **reply “got it”** from their P31 address. That proves the inbox can both receive and send.
4. If a reply lands in your spam folder, mark it **Not spam** and let us know.

Bluehost guide

Domain settings (DNS)

7 Find the domain settings (DNS)

1. In the Bluehost Portal's left menu, click **Domains**.
2. Click the domain (**p31market.com** or **thep31collective.org**).
3. Open the **DNS** tab. This is the list of records described below.

The same records also appear in cPanel under **Domains** → **Zone Editor**. Use either one; they're the same settings.

8 Records to leave alone

RECORD	WHAT YOU'LL SEE	WHAT IT DOES
A · host @	216.198.79.1	Sends p31market.com / thep31collective.org to the websites (Vercel).
CNAME · host www	ends in vercel-dns-017.com	Sends the www. address to the websites.
MX	mail.p31market.com / mail.thep31collective.org	Delivers all team email to Bluehost.
TXT · starts with v=spf1	...include:websitewelcome.com ~all	SPF: lists who may send email for us.
TXT · host default._domainkey	a long key	DKIM: signs our email so it's trusted.
TXT · host _dmarc	v=DMARC1; p=none	DMARC: tells inboxes how to treat fakes.

Never delete or edit these unless P31's developer asks you to. Deleting the MX record stops all team email. Deleting the A or CNAME record takes the website offline.

9 Adding a record when asked

Two services will each ask for a record. They change nothing else:

- **Google Search Console** gives a **TXT** record starting with `google-site-verification=`. It proves we own the domain so Google lists our new pages.
- **Our email-sending service** (for alerts, receipts and campaigns) gives a few records on its own sub-name, such as `send` or `resend._domainkey`.

1. On the **DNS** tab, click **+ Add record**.
2. Choose the **Type** (TXT, MX or CNAME) exactly as the service shows it.
3. Copy the **Host / Name** and the **Value** exactly. Use `@` when the service says "root" or leaves the name blank.
4. Click **Add**. Changes usually work within minutes, but can take up to a few hours.

Only one SPF record per domain. If a service asks you to add a record starting with `v=spf1` on `@`, don't create a second one. Send it to P31's developer to merge into the existing record. Two SPF records make email fail.

10 Keep it safe

- **Auto-renew on:** in **Domains**, confirm both domains are set to renew automatically and the card on file is current.
- **Two-step login** on the Bluehost account (step 3).
- **Share access, not passwords:** give the developer or team their own access instead of the main login.
- **Help is 24/7:** Bluehost chat (bubble at the bottom right of bluehost.com) or phone **888-401-4678** (7am–midnight ET).
